CIS NEWS

1. The first Digital Qazaqstan forum to be held in Shymkent

(astanahub.com)

In 2026, the Digital Almaty forum enters a new stage of development and transforms into Digital Qazaqstan – the country's main national technology forum, bringing together regions of Kazakhstan into a single platform for digital initiatives, IT companies, industrial customers, and government institutions across the country.

The first Digital Qazaqstan forum will take place on March 27, 2026, in the city of Shymkent, one of Kazakhstan's key industrial and economic centers. Starting from 2026, Digital Qazaqstan will be held annually in different cities across the country, forming a unified national ecosystem for Kazakhstan's technological and digital development. Hosting the forum in Shymkent creates opportunities for in-depth discussions on the digitalization of the real sector, the adoption of AI in industry, and the strengthening of ties between regions and the national technology ecosystem.

The theme of Digital Qazaqstan 2026 will be a new industrial era – "Industry 5.0: The Power of Collaboration." The Industry 5.0 concept focuses on harmonious interaction between humans and technology, where artificial intelligence, data, and robotics serve as tools to enhance human potential, increase economic efficiency, and ensure sustainable development. The forum will bring together representatives of government, business, international corporations, investors, technology companies, startups, and the expert community to discuss practical approaches to implementing digital and AI solutions across key sectors of the economy.

The forum's business program will include a plenary session, industry-focused panel discussions, roundtables, an exhibition of IT companies and startups, technology competitions and contests, hackathons, as well as the Digital Qazaqstan Awards ceremony, aimed at recognizing the best national and regional practices in digital and technological transformation.

Media accreditation is open until March 9, 2026, 6:30 PM. The registration form is available online. This is a unique opportunity to gain early access to key events, keynote speeches by industry leaders, and exclusive materials on the development of Kazakhstan's digital economy. We look forward to welcoming accredited media representatives at Digital Qazaqstan 2026 in Shymkent!

2. Subsoil users obliged to assign 1% of their income to R&D or Astana Hub

(Paragraph information system)

The Minister of Industry and Construction of the Republic of Kazakhstan signed executive order on 30 January 2026 introducing amendments to the Model Contracts for the types of subsoil use operations.

In accordance with changes, the subsoil user undertakes to annually finance research, scientific-technical, and experimental design work provided by Kazakhstani producers of goods, works, and services, and projects of Astana Hub innovation cluster participants in the amount of not less than one percent of the total annual income from contract activities based on the outcomes of the previous year.

(Read full document at https://prg.kz/document/?doc_id=34487224&pos=3;45)

3. Kazakh startup Higgsfield becomes AI Unicorn, signaling nation's tech aspirations

(The Times of Central Asia)

When Kazakh AI startup Higgsfield announced an $ 80 million funding round this month, its valuation soared past $ 1.3 billion, officially granting it "unicorn" status. For Silicon Valley observers, it marked another chapter in the ongoing boom in AI. But for Kazakhstan, a country seldom spotlighted in global tech circles, the milestone carries broader significance: the emergence of a homegrown company with global reach and competitiveness.

Higgsfield was co-founded by 29-year-olds Erzat Dulat and Alex Mashrabov. The startup focuses on AI-generated video tools tailored for marketing and social media use and currently reports annual revenue of $ 200 million. Remarkably, the company reached $ 10 million in recurring revenue within just a few weeks, a rare achievement, even in the fast-paced AI sector. Leading venture capital firms, including Accel, GFT Ventures, and Menlo Ventures, cited this momentum as a key factor behind their investment.

Rather than competing directly with giants like OpenAI or Google, Higgsfield leverages existing AI models to build practical tools for businesses. Its platform targets marketers, creative agencies, and social media professionals, an expanding segment that some analysts believe could rival traditional entertainment industries like Hollywood in both scale and value.

The company's success has not gone unnoticed by Kazakhstan's leadership. **President** Kassym-Jomart Tokayev recently met with Dulat and Murat Abdrakhmanov, founder of the venture capital platform MA7 Ventures, to discuss artificial intelligence's role in government, economic development, and national tech strategy. Tokayev praised

Higgsfield as a model of Kazakh innovation with global potential and reaffirmed the country's goal of becoming a launchpad for IT companies that can scale internationally without relocating abroad.

(Read full article at https://timesca.com/kazakh-startup-higgsfield-becomes-ai-unicorn-signaling-nations-tech-aspirations/)

4. Kazakhstan bets on Energy-to-AI pivot at World Government Summit 2026

(Astana Times)

Kazakhstan outlined its plans to develop a global hub for computing and data processing at the World Government Summit 2026, with a government delegation highlighting its intention to convert the country's energy potential into large-scale digital and AI infrastructure. Kazakh delegation, led by Deputy Prime Minister and Minister of Artificial Intelligence and Digital Development **Zhaslan Madiyev**, took part in the event.

Key meetings focused on the development of high-performance data centers and so-called AI factories. Discussions with **Sheikh Tahnoun bin Zayed Al Nahyan**, **CEO of G42 Holding, outlined concrete steps for expanding data storage and processing infrastructure**. **Sheikh Tahnoun**, a leading figure in the global AI landscape, is spearheading multibillion-dollar investments in AI infrastructure and partnerships with major technology companies in China, the United Arab Emirates, and the United States.

The delegation also met with UAE Minister of Energy **Suhail Mohamed Al Mazrouei** to discuss the creation of energy-efficient, low-carbon data centers. The discussions aligned with the concept of exporting not only energy but also clean, ready-made computing power, the ministry's press service reported on Feb. 5.

(Read full document at https://astanatimes.com/2026/02/kazakhstan-bets-on-energy-to-ai-pivot-at-world-government-summit-2026/#:~:text=For%20Kazakhstan%2C%20participation%20in%20the,%2C%20Telegram%2C%20YouTube%20and%20Tiktok!)

5. Starlink satellite internet now available in Tajikistan

(The Times of Central Asia)

Starlink, the satellite internet service operated by SpaceX, has officially launched in Tajikistan, the company announced on February 5. "Starlink's high-speed, low-latency internet is now available in Tajikistan," the company posted on X. The rollout expands Starlink's coverage in Central Asia, a region where mountainous terrain and remote settlements have long made stable internet access difficult.

Starlink is operated by Starlink Services LLC, a global telecommunications provider and wholly owned subsidiary of the U.S. aerospace company SpaceX, founded by Elon Musk.

The service operates via a constellation of low-Earth orbit satellites, delivering broadband internet to areas underserved by traditional infrastructure. It is now active in approximately 130 countries and territories worldwide.

The expansion into Tajikistan follows Starlink's earlier rollout in Kazakhstan. On June 12, 2025, Kazakhstan's Ministry of Digital Development, Innovation, and Aerospace Industry signed a formal agreement with Starlink, requiring the company to adhere to national telecommunications and information security regulations. This agreement paved the way for official use of the service by citizens, businesses, and government agencies, including in rural and hard-to-reach areas.

(Read full article at https://timesca.com/starlink-satellite-internet-now-available-in-tajikistan/)

6. Where motherhood meets innovation: the Kyrgyz startup Mama Space

(The Times of Central Asia)

Female tech founders face a lot more challenges globally, and Kyrgyzstan's startup ecosystem is unfortunately no exception. Being a nascent stage ecosystem makes things even worse: according to IFC, in emerging markets, only 11% of seed funding goes to startups with women on their founding team. Despite such significant barriers, there is a generation of female founders with global ambitions. One of them is Gulnaza Khalmanbetova, who is using technology to make pregnancy and motherhood more peaceful.

Mama Space provides an ecosystem for pregnancy and motherhood. Its pregnancy tracker covers every stage, providing an entire library of up-to-date, medically approved articles and educational videos. An AI chatbot can answer questions about pregnancy with evidence-based knowledge. And there is a loyal online community where every mother can find support and understanding.

"It was my second experience of pregnancy that prompted me to create the app. My second pregnancy was complicated and could have ended in tragedy. During one of the surgeries, in the fifth month of pregnancy, I promised myself that if everything went well for me and my unborn son, I would do everything possible to ensure that every mother could find support and not be left alone with her problems. This is how the idea of Mama Space was born – a platform designed so that every woman can go through the stages of motherhood with reliable informational support," recalled Gulnaza Khalmanbetova, CEO and Founder of Mama Space.

GLOBAL NEWS

7. Singapore: budget 2026 to "Pivot Toward Technology"

(sbr.com)

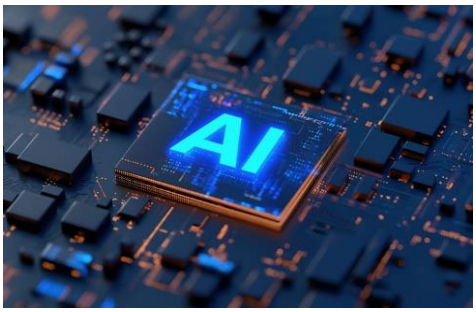
Singapore's upcoming Budget 2026 is expected to focus on a major problem: the country is running out of land and its workforce is getting older. To keep the economy growing without more people, **the government plans to spend heavily on technology and Artificial Intelligence** *(AI)*. Experts believe the goal is to help businesses work smarter rather than harder.

Currently, big companies are using AI well, but small businesses are falling behind. Analysts expect the budget to fix this by offering money to help smaller firms adopt new tools and by funding training programs to teach workers tech skills. This effort marks the start of a massive $ 37 billion, five-year plan designed to make Singapore a global leader in research and innovation.

(Read full article at https://sbr.com.sg/economy/in-focus/budget-2026-surge-tech-funding-ageing-workforce-squeezes-growth-analysts)

8. Due to AI, already deficit SLC NAND will rise in price by 400–500%

(Habr)



The AI-Driven Memory Shortage: Q2 2026 Market Context

The transition to complex AI hardware, specifically the shift from NVIDIA's GB200 to the **GB300**, has triggered a severe shortage of high-capacity memory components in the first half of 2026. The GB 300's higher specifications have spiked demand for 512 MB and 1 GB NOR Flash modules, creating a critical bottleneck.

Price Explosion *(Q2 2026)*

NOR Flash: After rising significantly in Q1, prices are projected to increase another **40–50%** sequentially in Q2, with lead times extending to 12–14 weeks.

The exit of major manufacturers from this niche has left the remaining supply consolidated. Consequently, contract prices are expected to skyrocket by **400–500%** year-over-year.

Taiwanese manufacturers **Winbond** and **Macronix** have become the primary suppliers. Winbond is aggressively reallocating production lines from legacy DRAM to Flash memory to meet demand, noting that new capacity planned for 2027 is already fully booked. Macronix reports its NAND revenue share has doubled, yet inventory remains insufficient to fulfill orders despite advance client payments. The shortage is so acute that downstream

clients are bypassing distributors to negotiate directly with manufacturers to secure guaranteed stock.

The memory market is experiencing an AI-induced "super-cycle." **With SLC NAND prices facing a 500% hike and NOR Flash supply strictly allocated**, this is a structural deficit rather than a temporary fluctuation. The consolidation of suppliers and the fact that 2027 capacity is already sold out indicates that high costs and limited availability for AI-grade memory will persist as a long-term constraint on the hardware industry.

(Read full article at https://habr.com/ru/companies/bothub/news/994200/)

9. OpenAI will create a separate version of ChatGPT for the UAE – one that will take local culture and laws into account

(Habr)

OpenAI is currently negotiating with a technology holding group called **G42** in Abu Dhabi to build a special version of ChatGPT specifically for the United Arab Emirates. The primary user of this new tool is expected to be the UAE government.

This custom AI is being designed to perfectly understand the local Arabic dialect and, more importantly, to strictly follow the country's laws and cultural values. It essentially creates a "government-approved" AI that aligns with the political views of the monarchy.

The standard global version of ChatGPT will still be available to the public in the UAE, though it will block specific content that is illegal there. However, the report notes that adapting AI for strict censorship is very difficult. Unlike standard software, **AI is unpredictable, making it hard to control perfectly. There is also a constant risk that users might find ways to "jailbreak" the system to bypass these rules**, or simply switch to open-source AI models that have no restrictions at all.

This project marks a shift where major US tech companies are willing to deeply modify their products to fit the strict political requirements of foreign governments. By partnering with G42 *(which is led by the UAE's National Security Advisor)*, OpenAI is attempting to secure a place in a wealthy, regulated market by offering a tool that balances advanced technology with state control.

(Read full article at https://habr.com/ru/companies/bothub/news/994134/)

10. AI has learned to predict battery lifespan 50 times faster

(Habr)

Faster Battery Testing with "Discovery Learning"

Researchers at the University of Michigan have developed a new AI method called "Discovery Learning" that drastically speeds up the testing of Lithium-ion batteries.

The problem is that, normally, to find out how long a new battery will last, engineers have to charge and drain it thousands of times until it dies. This process, called "cycling," takes months or even years and uses a massive amount of electricity.

The new method changes the rules. Instead of testing a battery until it fails *(e.g., 2,500 cycles)*, the AI only needs to see the first **50 cycles**. Based on that small amount of data, it can predict the battery's entire lifespan with very high accuracy *(only a 7.2% error rate).*

- **Speed:** It cuts testing time by **98%** *(reducing months of work to just one week).*
- **Energy:** It reduces energy use by **95%**.
- **Better Design:** Unlike old methods that required a finished prototype to be fully tested, this allows engineers to predict how good a battery design is very early in the process.

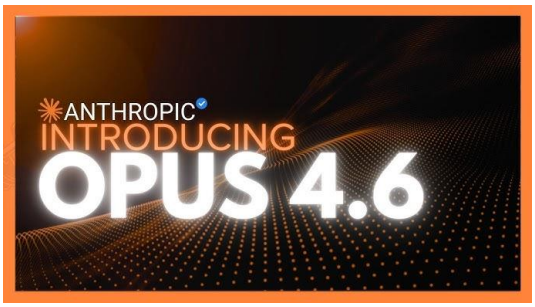
The AI mimics how a scientist thinks. It combines data from older battery types with the laws of physics. It doesn't need to see a specific new battery design die to understand it; it learns from the past and uses a "short quiz" *(the 50 cycles)* to figure out the future.

This method removes the biggest bottleneck in the battery industry. By predicting lifespan in a week rather than a year, companies can develop better batteries for cars and electronics much faster, saving huge amounts of money and energy in the process.

(Read full article at https://habr.com/ru/news/994092/)

11. Anthropic has made Claude Opus 4.6 – 2.5 times faster – but at a higher price

(Habr)



Anthropic has launched a "fast mode" for its flagship Claude Opus 4.6 model, designed to operate **2.5 times faster** than the standard version. Currently available as an early experiment in Claude Code and via API, this mode is specifically targeted at interactive workflows where low latency is critical.

This speed upgrade is not included in standard Pro or Max subscriptions. Instead, it is billed separately under an "extra usage" model. The cost is significantly higher – **6 times the price** of the standard **Opus 4.6 – set at $ 30 per million input tokens and $ 150 per million output tokens.**

To encourage adoption, Anthropic is offering a 50% discount until February 16. Additionally, Pro and Max users who subscribed before February 4 receive $ 50 in free credits *(valid for 60 days)* to test the feature. Team, Enterprise, and API-only users are excluded from this free credit offer.

Operational risks are that users must manually activate "extra usage" in their settings. If credits are exhausted, the system automatically reverts to the standard speed.

A critical technical detail for users is that activating fast mode in the middle of an existing conversation will cause the entire context history to be re-calculated at the higher price rate.

(Read full article at https://habr.com/ru/news/993962/)

12. Pax Historia: viral hit, but too expensive to run

(Habr)

A new startup in San Francisco has a popular hit called Pax Historia. It is a strategy game played in a web browser that runs entirely on Artificial Intelligence *(AI).* Even though the company spent zero money on marketing, the game is very successful. It has 35,000 players every day, and they have played nearly 20 million rounds.

This game is different because it does not use pre-written scripts. Instead, it uses a smart AI. Players pick a country and a time period, then simply type orders in plain English *(like "Build a military base in Scotland" or "Ask France for a trade deal")*. The AI figures out how other countries react and updates the map and wars instantly. Because of this, every game is unique.

To work, the game uses many different AI models, including powerful ones like GPT-5.1. This requires a lot of computing power, which makes it very expensive. In just one week, the game processed a massive amount of data. Because the costs are so high, showing ads to players is not enough to pay the bills.

Right now, the situation is difficult. **Google limited the startup's access to the technology, so the game had to pause its paid "Patron" subscription.** They also had to put strict limits on how much free users can play each day.

Players are using the game to create their own stories. The community has made over 4,000 scenarios. These range from "What if?" history lessons *(like the USSR surviving)* to sci-fi stories like zombie apocalypses. The developers encourage this by giving creators a small share of the earnings.

Pax Historia shows how gaming is changing from written scripts to endless AI stories. However, it also shows that AI software is a risky business right now. While the game is amazing, the business model is weak because it is too expensive to run and relies too heavily on big tech companies like Google

(Read full article at https://habr.com/ru/news/993940/)

13. Qatar announces expansion of QIA's Fund of Funds program, welcoming new global VCs

(Qatar Investment Authority – QIA)

His Excellency the Prime Minister and Minister of Foreign Affairs Sheikh **Mohammed bin Abdulrahman bin Jassim Al-Thani** has announced the expansion of QIA's Fund of

Funds program, an additional $ 2 billion of funding to the program, bringing the total capital commitment for the program to $ 3 billion.

In addition to this capital milestone, His Excellency also announced that five new funds are joining the Fund of Funds program, representing specializations across AI, fintech, blockchain technology, infrastructure and special situations. **The Fund of Funds program now supports 12 regional and international fund managers in Qatar, demonstrating the significant growth of Qatar's startup ecosystem and its increasing connectivity to global markets.**

The latest funds to join the program are:

• Greycroft: A multi-stage, multi-strategy venture capital firm that manages over $ 4 billion in assets; partners with entrepreneurs building category-defining companies across software, sustainability, and consumer brands.

• Ion Pacific: A leading venture capital firm managing innovative strategies focused on risk-reward optimization for investors, and provides tailored solutions that unlock liquidity for founders, GPs and LPs in the VC ecosystem.

• Liberty City Ventures: A leading venture capital fund and incubator with $ 2.4 billion of assets under management. The firm invests in companies building and implementing blockchain technology solutions *(Seed through Series C+)* with a focus on financial services; AI and data; and infrastructure.

• Shorooq: A tech-focused, multi-strategy investment firm from the GCC. Shorooq's strategies span venture capital, credit, private equity, and real assets through an integrated approach that allows them to invest across the capital stack in businesses reshaping their sectors, from fintech and software to AI, industrials, and infrastructure.

• Speedinvest: A globally active European venture capital firm with more than € 1.2 billion in AuM and six offices across EMEA.

AI Compute power announced for fund managers and start-ups

QIA and Qatar Development Bank *(QDB)* have also announced that they are partnering to offer compute power provided by Qatar's new AI company Qai, which develops and invests in advanced AI infrastructure and systems.

(Read full article at https://www.qia.qa/en/Newsroom/Pages/Qatar-Prime-Minister-and-Minister-of-Foreign-affairs-announces-expansion-of-QIAs-Fund-of-Funds-program-welcoming-new-global-VCs-to-Qatar.aspx)

ANALYSIS

14. US software stocks tumble sparks concerns that AI trade is reshaping markets

(Reuters)

The software and services industry's recent plunge has ignited fears that the artificial intelligence boom may be reshaping markets in unexpected ways, raising questions about whether a rotation out of technology stocks signals trouble ahead for the AI trade.

Financial markets, juiced for months with investor enthusiasm about the artificial intelligence trade, got a rude awakening last week as software stocks around the globe sank on worries that fast-advancing AI tools could upend the industry.

While a rebound in the broader market helped soothe nerves, the outlook for U.S. software stocks, at the epicenter of the selloff, remained murky. Despite a 2% rebound on Friday, options market participants remained on high alert for further pain.

The selloff, which crossed continents knocking stocks from Europe to Asia, was triggered by a new legal tool from Anthropic's Claude large language model that raised existential questions about traditional software business models.

Investors are questioning whether the earnings-compounding nature of software companies would get disrupted, with strategists noting a broader rotation into value and cyclical-oriented sectors such as consumer staples, energy and industrials.

Software and services stocks' underperformance against the S&P 500 has reached near-record proportions, with the sector lagging the benchmark by nearly 24 percentage points over the past three months, nearly the worst such gap in data going back three decades.

The downturn marks a stark reversal for the industry group that overall put up outsized gains for much of the post-pandemic era, when investors bet on digital transformation and cloud computing.

The current selloff rivals only a handful of periods since 1995, including the dot-com crash of 2000-2001, when the spread plunged below negative 25.

To be sure, historically, such extreme readings have sometimes preceded either capitulation selling or marked attractive entry points for contrarian investors, though the 2000-2001 period showed underperformance could persist for extended stretches.

(Read full article at https://www.reuters.com/business/media-telecom/us-software-stocks-tumble-sparks-concerns-that-ai-trade-is-reshaping-markets-2026-02-09/

15. TSMC to make advanced AI semiconductors in Japan in boost for its chipmaking ambitions

(The Associated Press)

Taiwan's chipmaker TSMC said that it will be manufacturing some of the world's most cutting-edge semiconductors in Japan to meet booming artificial intelligence-related demand, in a boost for the country's chipmaking ambitions.

Taiwan Semiconductor Manufacturing Corp., a major chip supplier to companies such as Nvidia and Apple, said it plans to make 3-nanometer semiconductors – advanced chips that are used in areas such as AI products and smartphones – at its second factory in Japan's Kumamoto Prefecture, which is under construction.

The decision by TSMC, the world's largest contract chip maker, was a coup for Prime Minister **Sanae Takaichi** ahead of a general election on Sunday, where she hopes to secure the public's mandate for her policies riding on high approval ratings.

The announcement came while Takaichi was meeting with TSMC's CEO and Chairman, C.C. Wei, in Tokyo.

"It is very meaningful from the perspective of Japanese economic security, and I would like the project to move forward as proposed, by all means," Takaichi said during the meeting.

The advanced chips set to be made in Kumamoto will be used in AI, robotics and autonomous driving, sectors that Takaishi's cabinet has designated as strategically important fields.
